SUMMARY

Senior backend engineer with 7+ years of experience designing and operating distributed systems in Rust, Python, and TypeScript. Specialized in high-throughput ingestion pipelines, reliable event-driven architecture, and cloud-native platform engineering. Combines deep systems thinking with practical delivery: translates ambiguous product goals into measurable engineering outcomes, mentors teams on architecture and operations, and maintains production-grade open-source tooling including the typst-resume template.

EXPERIENCE

Acme GmbH 03.2022 – present
Berlin, Germany

Senior Software Engineer

- Architected and implemented distributed ingestion pipeline using Rust, Apache Kafka, and PostgreSQL, reducing p99 latency by 40% and increasing sustained throughput from 18k to 31k events/sec.
- Led migration of 3 legacy services to domain-aligned microservices with explicit API contracts, enabling independent deployments and cutting cross-team release coordination from weekly to on-demand.
- Introduced idempotent consumer patterns, DLQ handling, and replay tooling, reducing production incidents related to duplicate/out-of-order events by 65%.
- Designed observability stack with service-level dashboards and SLO alerts (Prometheus + Grafana), reducing mean time to detect regressions from 25 to 7 minutes.
- Mentored 2 junior engineers through structured weekly code reviews and pair sessions on async Rust, testing strategy, and incident response runbooks.

Startup OÜ 06.2019 – 02.2022
Tallinn, Estonia

Software Engineer

- Implemented OAuth 2.0 and passwordless authentication flows using FastAPI, Redis, and PostgreSQL, supporting 50k+ monthly active users with secure session lifecycle handling.
- Reworked CI strategy in GitHub Actions by splitting unit/integration/e2e lanes and introducing dependency caching, reducing median pipeline time from 18 to 6 minutes.
- Hardened auth edge cases including token refresh races, revoked sessions, and adaptive rate limiting, significantly reducing support tickets during public launch quarter.
- Implemented multi-tenant access model with org-scoped roles and audit trails, unblocking enterprise pilot customers and shortening onboarding time by 30%.

Thesis & open-source — distributed systems Lviv, Ukraine

- Completed M.Sc. coursework and thesis at Lviv Polytechnic focused on distributed messaging reliability and queue backpressure behavior under burst traffic.
- Built simulation tooling in Python to evaluate retry policies and consumer lag dynamics; several heuristics were later applied in production at Startup OÜ.
- Published internal technical notes on partitioning strategies and failure-mode testing that became onboarding material for new backend engineers.

EDUCATION

Lviv Polytechnic National University 09.2016 – 06.2021
Lviv, Ukraine

M.Sc. Computer Science

Grade: 5.0 / 5.0

SKILLS

Languages: Rust, Python, TypeScript, SQL
Infrastructure: Kafka, PostgreSQL, Redis, Docker, Kubernetes, Terraform, AWS Frameworks &
Tooling: FastAPI, Tokio, Actix Web, GitHub Actions, Prometheus, Grafana, OpenTelemetry
Concepts: Microservices, Event-Driven Architecture, REST, Domain-Driven Design, Resilience Patterns, CI/ CD

CERTIFICATIONS

AWS Solutions Architect – Associate · Amazon Web Services 11.2023
CKAD: Certified Kubernetes Application Developer · Cloud Native Computing Foundation 04.2024

LANGUAGES

Ukrainian — C2 · English — C1 · German — A2
